

Room Vision: Smart Living Design for Students

VJ Vanderlipe (vrv7),
Eric Verdes (edv23),
Pedro Arruda (poa22),
Kai Barker (kfb36)

Design Problem

Many college students struggle to personalize their living spaces efficiently while balancing functionality and aesthetics. This project aims to solve the challenge of limited tools and inspiration for designing dorms or small apartments.

Motivation: Our solution bridges the gap between creativity, usability, and functionality by leveraging AR and AI technologies for room design.

Insights

1. Users prefer simple, intuitive tools for room layout design.
2. Many students look for inspiration from peers but lack an easy way to connect with a design community.
3. AR and AI features are appreciated but must be seamless and non-intrusive.
4. Users value the ability to save and revisit designs for future reference.

Design Concepts

Overview:

- Our app combines AR room visualization, AI-powered design suggestions, and community interaction to create an intuitive and interactive experience for users.

Response to User Insights:

- Drag-and-Drop Tools: Simplifies room layout customization.
- Community Inspiration: Users can browse and share room setups for creative inspiration.
- AI Suggestions: Offers tailored design recommendations based on user preferences and room dimensions.
- Seamless AR Integration: Provides a live visualization of potential room layouts.

Prototypes

Low Fidelity:

Focused on basic layout and navigation flow.

High Fidelity:

Enhanced visuals, interactivity, and usability based on user feedback.
